

IMPORTANT INFORMATION

Another way to help protect our water system is by customers practicing Dept of Health & Hospitals approved Back Flow Prevention methods. The most recommended method is the use of an air gap when filling farm water tanks, swimming pools, garden sprayers and any other applicators where chemicals are being mixed with water. For further information on Back Flow Prevention contact our office.

In an effort to better serve our customers we are asking any customer who needs to be informed of Boil Water Advisories other than by means of radio and television to please contact our office and provide contact numbers where you can be reached at all times.

Just a reminder that all customers must have a cut off valve installed on their side of the water meter. Cut off valves in the concrete boxes are for water department use only.

Any customer damaging water department cut off valves will be charged parts and labor for repair.

We ask our customers to keep the area around your water meter clean--Do Not plant trees, bushes, or shrubs around the water meter.
